Data Management
Data Management Guide

Writing a data plan

Why do I need a data management plan?
- Duke policies related to data management, sharing, and retention
- Funding agency policies related to data management, sharing, and retention
- Details on the NSF data management plan requirements

Sample plans/templates
- Duke-specific guidance on writing a data plan for NSF (PDF document)
- DMPTool - data management planning toolkit from the California Digital Library
- ICPSR Sample Data Management Plan

Managing your data

- The data management process - thinking it through from beginning to end of your project life-cycle
- Storage and backup - please ask your IT provider to contact askdata@duke.edu to discuss how to include appropriate data management practices into planning for data storage and backup.
- Metadata - describing your data to facilitate later use
- Data archiving and preservation - making sure your data is around for a long time

Sharing your data

- Data repositories - places to deposit and share your data
- Licensing and intellectual property - how may others use your data?
- Data citation - getting credit for what you've shared, and giving credit to others for what you've used

Get help at Duke

This web site will help you started with information on effective management of data you are creating through your research, including developing a data management plan for your grant or project proposal, archiving data at the end of your project, and sharing data with other researchers as appropriate.

If you're a member of the Duke community, Library Data and GIS Services is available to help you with your data management planning. Contact askdata@duke.edu or see our walk-in consulting schedule. We can advise you and connect you with others who may be able to provide the support you need to execute your data management plans.

Other sources of help at Duke related to data management are also available.

Why manage and share your data?

Funding Agency Requirements

Many funding agencies require data management plans for different reasons. Tailor your plan to the goals and requirements of the funding agency. Funders typically ask how you will:
- Protect confidentiality, consent, and safety of research subjects
- Promote data sharing and transparency
- Supports efforts to verify and replicate research findings

Transparency and Replication of Research Findings

- Replication relies on clear documentation of data and changes used in analyses
- Reuse of data for new applications is common in most disciplines
- Requests for data may follow from publication of results, and advance preparation simplifies the response process

Data Preservation and Annotation

- Documentation of data items and structure at the time of compilation reduces the time needed to understand data organization and contents should the data be needed in future
- Duke requires the retention of research data and pertinent notes for at least 5 years after completion of a project
- Early attention to data documentation and preservation plans reduces the effort required to transition to permanent storage
- Changes in research staff impact the progression of a research project to a lesser extent with clear documentation and planning
- Preservation in a data repository provides an additional backup for your research data

Citations and Recognition

- Data repositories provide another route to the discovery of your research and can increase the visibility of your work, especially when used widely

Data management guidance elsewhere

Some sources of guidance on data management from other universities:
- University of Wisconsin-Madison Research Data Services
- University of Virginia Scientific Data Consulting Group
- MIT Data Management and Publishing
- ICPSR Guidelines for Effective Data Management Plans
- Online course on data management from the EDINA National Academic Data Centre in the UK
Data Management Planning Workshop

- Data Management Planning

Manage Your Research Data

Reasons to Manage and Publish Your Data:

- Increase the visibility of your research: Making your data available to other researchers through widely-searched repositories (such as Georgia Tech's SMARTech) can increase your prominence and demonstrate continued use of the data and relevance of your research.
- Meet grant requirements: Many funding agencies, such as the National Science Foundation, now require that researchers include data management or data sharing plans in their proposals. They may also require deposit of research data in a data archive.
- Save time: Planning for your data management needs ahead of time will save you time and resources in the long run.
- Increase your research efficiency: Have you ever had a hard time understanding the data you or your colleagues have collected? Documenting your data throughout its life cycle saves time by ensuring that in the future you and others will be able to understand and use your data.
- Maintain data integrity & reliability: Responsible data management protects data from falsification and preserves confidential information. It can also clarify the ownership of property rights.
- Preserve your data: Depositing your data in a trusted repository can ensure that they will be available to you and other researchers in the long-term. Doing so safeguards your investment of time and resources and preserves your unique contribution to research.
- Facilitate new discoveries: Enabling other researchers to use your data reinforces open scientific inquiry and can lead to new and unanticipated discoveries. And doing so prevents duplication of effort by enabling others to use your data rather than try to recreate the data themselves.
- Support Open Access: Researchers are becoming increasingly advocates for researchers to share their data in order to foster the development of knowledge.

"...[A] major benefit for contributors [to a data archive is that they] will always be able to find and copy their previously submitted files from the long-term archive." -- Big opportunities in access to "small science" data, Onsrud, Harlan and James Campbell, Data Science Journal, Volume 6, Open Data Issue, 17 June 2007 p.7

**Representative Documents: Data Management**

**Data Management Plans**

Creating a data management plan for access, sharing, and preservation

**What Data?**

- **What will be collected?**
- **What format will the data be in?**
- **How long should the data be stored?**
- **Is there potential for the data to be re-used in other inquiries?**
- **How large will the datasets be?**
- **Who owns the data?**

**Create a Data Management Plan**

- **What metadata or standardized tags will you use?**
- **How will you ensure the data while your research is in progress?**
- **What documentation is needed to keep the data accessible throughout the project and after?**

**Collect and Document**

- **Back-up data and documentation in at least three places, e.g., hard drive, thumb drive, and web space.**

**Analyze Data**

- **Back-up data and documentation.**
- **Leave your original data intact using copies to perform analyses.**
- **Include algorithms, formulae, methods in your documentation (use a scripting software such as R to document your analyses).**

**Prepare Data for Sharing**

- **Datasets should be in file formats compatible with repository support.**
- **Metadata (tags) added to enable discovery.**

**Archiving and Preservation**

- **Add to metadata, include published research associated with data.**

**Deposit Data**

- **Complete forms for depositing data in repository.**

**Defining Research Data**

- **United States Circular No. A-110**
  - The U.S. Federal Government’s Office of Management and Budget Circular A-110 (36.C.2 Property Standards; Intangible property; (definition) states: Research data is defined as the recorded factual material commonly accepted in the scientific community as necessary to validate research findings, but not any of the following: preliminary analyses, drafts of scientific papers, plans for future research, peer reviews, or communications with colleagues. This “recorded” material excludes physical objects (e.g., laboratory samples). Research data also do not include:
    - Trade secrets, commercial information, materials necessary to be held confidential by a researcher until they are published, or similar information which is protected under law; and
    - Personnel and medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study.

- **National Institutes of Health (NIH) Data Sharing Policy**
  - **Definition of Final Research Data**
    - Recorded factual material commonly accepted in the scientific community as necessary to document and support research findings. This does not mean summary statistics or tables; rather, it means the data on which summary statistics and tables are based. For the purposes of this policy, final research data do not include laboratory notebooks, partial datasets, preliminary analyses, drafts of scientific papers, plans for future research, peer review reports, communications with colleagues, or physical objects, such as gels or laboratory specimens. NIH has separate guidance on the sharing of research resources, which can be found at NIHGPS.

- **National Science Foundation (NSF) Sharing Data**
  - NSF expects significant findings from research and education activities it supports to be promptly submitted for publication, with authorship that accurately reflects the contributions of those involved. It expects investigators to share with other researchers, at no more than incremental cost and within a reasonable time, the data, samples, physical collections and other supporting materials created or gathered in the course of the work. It also encourages grantees to share software and inventions or otherwise act to make the innovations they embody widely useful and usable.

Data Management Planning for Researchers at NC State

What is a Data Management Plan (DMP)?
A data management plan is a formal document that outlines what you will do with your data during and after you complete your research. It describes the data that will be created, the standards used to describe the data (metadata), who owns the data, who can access the data, how long the data will be preserved (and/or made accessible), and what facilities and equipment will be necessary to disseminate, share, and/or preserve the data. Several funding agencies require or encourage the development of data management plans for research.

Specific guidelines for data management planning from NSF, NIH, DOE, NASA, NEH

How do you write a DMP?
A Data Management Plan consists of many elements describing the preservation, sharing, and access for your data. For a breakdown of the primary elements to include in your data management plan, see:
- Elements of a Data Management Plan
- Examples of Data Management Plans

Who can you contact if you need help or have questions?
NCSU's Sponsored Programs and Regulatory Compliance Services (SPARCS), working with the NCSU Libraries and NCSU's Office of Information Technology (OIT) Shared Services group, is providing consultation for data management and discovery for research data associated with requirements of grant funding agencies.

For questions or support with writing data management plans or implementing data management practices, contact:
- NCSU Libraries Research Data Services
  library_datamanagement@ncsu.edu
- John Chaffee
  Director, Sponsored Programs and Regulatory Compliance Services (SPARCS)
  john_chaffee@ncsu.edu
- Eric Sills
  Director of Shared Services, NCSU Office of Information Technology
  eric_sills@ncsu.edu
- William Cross
  Director, Copyright & Digital Scholarship Center, NCSU Libraries
  william_cross@ncsu.edu

For more information about complying with grant funding requirements, contact:
- John Chaffee
  Director, Sponsored Programs and Regulatory Compliance Services (SPARCS)
  john_chaffee@ncsu.edu

For more information about data storage options at NCSU contact:
- Eric Sills
  Director of Shared Services, NCSU Office of Information Technology
  eric_sills@ncsu.edu

For more information about copyright and intellectual property regarding your data and publications, contact:
- Will Cross
  Director, Copyright & Digital Scholarship Center, NCSU Libraries
  william_cross@ncsu.edu

Data Management Toolkit

**Describing Data**
- Provides guidelines for describing data, including how to identify, describe, and label the data to be collected.
- Access - outlines considerations for sharing and distributing data.
- Storing and Preserving - addresses long-term plans for data storage and preservation.

**Accessing Data**
- Provides access to data management tools and resources available through Penn State University Libraries.

**Storing and Preserving Data**
- Offers guidance on storing and preserving data to ensure long-term accessibility and integrity.

**Publishing and Curation Services**
- Provides information on data curation services offered by the university, including best practices for managing data throughout its lifecycle.

**Scholarly Communications**
- Highlights the importance of scholarly communications in data management, emphasizing the need for clear and effective communication strategies.

**Service Statement**
- Details the commitment to providing quality data management services and the resources available to support researchers.

**Contact**
- Provides contact information for the University Libraries at Penn State University, including phone numbers and email addresses for further assistance.

Texas A&M University Research Data Taskforce

This Guide is for you....

if you've ever ....

- Wanted to store your research data safely and securely on a trusted server
- Needed to comply with a funding agency's requirements for a Data Management Plan
- Wished to link your research data to your research articles
- Wondered how to make sure your research data can be reused over time
- Looked for available data on a given topic, time period or geographic location

Data Management Support at the Texas A&M Libraries

The University Libraries offer a variety of services to support data management efforts by Texas A&M researchers:

- Raising awareness of best practices in data management and data management planning
- Collecting examples of "successful" data management plans submitted with funded proposals
- Consulting with researchers on existing metadata formats and controlled vocabularies that can be used to document data for a particular project
- Assisting in finding data repositories where Texas A&M researchers may submit, share and preserve their data
- Raising awareness of data preservation issues

We invite you to explore the pages of this LibGuide and let us

What Is Data Management?

In the context of research and scholarship, "Data Management" refers to the storage, access and preservation of data produced from a given investigation. Data management is practiced through the entire lifecycle of the data, from planning the investigation to conducting it, and from backing up data as it is created and used to long term preservation of data deliverables after the research investigation has concluded.

Specific activities and issues that fall within the category of Data Management include:

- File naming: the proper way to name computer files
- Data quality control and quality assurance
- Data access
- Data documentation (including levels of uncertainty)
- Metadata creation and controlled vocabularies
- Data storage
- Data archiving & preservation
- Data sharing and re-use
- Data integrity
- Data security
- Data privacy
- Data rights
- Notebook protocols (lab or field)

Why Bother with Data Management?

Data Management is useful to investigators because it helps to

- Organize data
- Store and backup data
- Take care of data so it is readily available for ongoing use
- Preserve data for future re-use
- Share data with colleagues
- Comply with university rules and protocols for research integrity
- Comply with funder requirements

Who Is Responsible for Data Management?

Data management is commonly a shared responsibility

- Researchers generally have a high level of expertise in handling and manipulating datasets
- Data scientists may work closely with dataset creators to manipulate, visualize and analyze the data
- Data managers steward the dataset through its life cycle to ensure its usefulness and fitness for re-use both during and after a given research project is concluded.

Data managers may be investigators, research assistants, graduate students, information technology specialists, informaticists, research librarians, or some

Making Data Management Easier

Libraries have been managing information for 4,000 years. Today, your libraries are evolving and building expertise to continue this tradition so that they can help you preserve research data of the past, present, and future.

The Data Management Consulting Group is ready to consult with you on your entire data life cycle, helping you to make the right decisions, so that your scientific research data will continue to be available when you and others need it in the future. Contact us now to start a conversation about your research.
